

# The Components of Matter

Reading: Ch 1 sections 1 - 5    Homework: Chapter 1: 37, 39, 41, 43, 45, 47\*, 49

\* = 'important' homework question

Review: What is matter?

Recall: "Chemistry is the study of matter and its *properties*, the changes matter undergoes and the *energy* associated with those changes"

Recap: There are 3 **stable** states of matter – *solid* (s), *liquid* (l) and *gas* (g).

Specific *macro-* and *microscopic physical* properties define the three\* states of matter

<u>State of Matter</u>	<u>Macroscopic Description</u> (observation)	<u>Microscopic Description</u> (chemical model)
Solid		
Liquid		
Gas		

**The state matter is in depends on the strength of the forces (chemical bonds) between the individual microscopic particles within the matter**

Task: Rank the *intermolecular* forces present in steam, ice and water in order of increasing strength. Use the included figures as a guide.

Ranking

## Changing between the 3 states of matter

Describe the relationship between the mpt. and bpt. of matter, with regard to *microscopic* processes, occurring at these specific temperatures

Example: The boiling of water to make steam ( $\text{H}_2\text{O}_{(l)} \rightarrow (\text{H}_2\text{O}_{(g)})$ )

$\text{H}_2\text{O}_{(g)}$

$\text{H}_2\text{O}_{(l)}$

## Physical and Chemical Properties – what’s the difference?

Analogy: We all possess ‘as is’ physical properties, or characteristics, that define us. For example, Dr. Mills is 5’11” and has green eyes.

As with people, each chemical also possesses a unique set of ‘*as is*’ **physical properties** that define it. For example, water is a clear, colorless, tasteless molecular material that has a fpt. of 0°C and a bpt. of 100 °C.

**Chemical Properties**, in contrast, are a function of *change* (usually associated with a chemical reaction). For example, Iron (Fe) reacts with oxygen gas to form rust:

Task: Identify the following as *either* chemical or physical properties

Property	Chemical or Physical
Diamond is the hardest known substance.	
Charcoal burns to make CO <sub>2</sub> (g)	
The statue of liberty turned ‘green’	
Copper is a good conductor of electricity	
Sugar dissolves in water*	
Melting of ice*	

Think up two more chemical properties of your own

**Elements and Compounds** – the further classification of *pure* matter

Task: State which of the following are *elements*, and which are *compounds*.  
When done, try to come up with a definition of what elements and compounds are.

<u>Material</u>	<u>Chemical Formula</u>	<u>Element or Compound?</u>
Water	H <sub>2</sub> O (l)	
Oxygen gas	O <sub>2</sub> (g)	
Pure silver coin	Ag (s)	
Sugar crystals	C <sub>6</sub> H <sub>12</sub> O <sub>6</sub> (s)	
Carbon dioxide gas	CO <sub>2</sub> (g)	

**Elements:**

**Compounds:**

Compounds and elements can have either '*giant*' or *molecular* structures:

'Giant': Repeating *lattice* of particles – usually strongly bound (high mpt.) solids.

Examples: sand ( $\text{SiO}_2$ ), diamond (C), table salt ( $\text{NaCl}$ )

Molecular: a collection of *independent* molecular units (molecules will be discussed in more detail later). Usually (low mpt) liquids or gasses at room temp.

Definition: ***Molecule*** – a small, independent particle of matter made up from 2 or more atoms

Examples: water ( $\text{H}_2\text{O}$ ), carbon dioxide ( $\text{CO}_2$ ), Nitrogen gas ( $\text{N}_2$ )

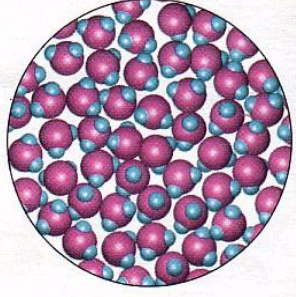

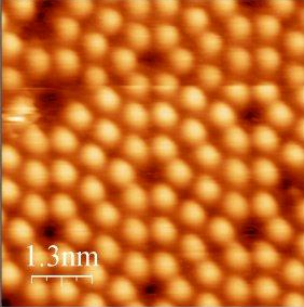

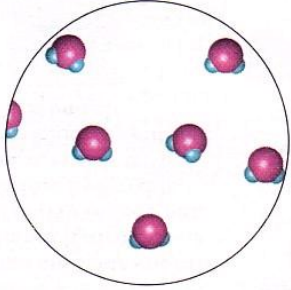

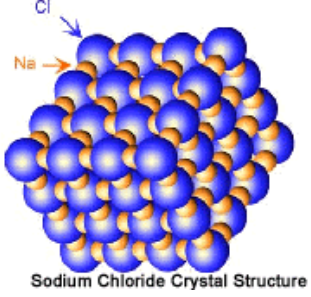

**Think of molecules like cars on the expressway – each car (molecule) is a separate, independent unit that contains a number of passengers (atoms). The cars (molecules) are free to move while the people (atoms) stay fixed inside.**

**'Giant' materials are like people (atoms) 'locked' in place at a *very* crowded concert, the DMV waiting room etc.....**

Review: A microscopic scale view of several materials is presented below. Label each using *elemental* or *compound* **and** *molecular* or '*giant*' tags

<p><u>Water (H<sub>2</sub>O (l))</u></p> 	<p><u>Silicon (Si (s))</u></p> 
<p><u>Steam (H<sub>2</sub>O (g))</u></p> 	<p><u>Sodium Chloride (NaCl)</u></p>  <p>Sodium Chloride Crystal Structure</p>

Details: Ice is a solid (crystalline) form of water (a molecular compound). How would you describe the structure of ice? Can you think of other similar examples?

More Details: Allotropes of an Element

Example:  
Carbon

C<sub>(diamond)</sub>

C<sub>(graphite)</sub>

C<sub>60</sub>

## Pure Matter v Mixtures

Recap: **Pure matter** is classed as *either* an ELEMENT *or* a COMPOUND.

**Elements can have *either* Molecular *or* ‘giant’ structures.**

Examples:  $\text{N}_2$  (g) (Nitrogen gas, molecular),  $\text{Pb}$ (s) (metallic lead, a ‘giant’ structure)

**Compounds can also have *either* Molecular *or* ‘giant’ structures.** Examples:  $\text{H}_2\text{O}$ (l) (water, molecular),  $\text{Fe}_2\text{O}_3$ (s) (‘rust’ (iron oxide), a ‘giant’ structure)

Recall: **A molecule is an independent unit containing two or more atoms.** Remember the car / passenger analogy. Molecules can exist as *either* elements *or* compounds

## Mixtures

**ANY combination of different types of pure matter ‘placed together’ is defined as a mixture (eg. air, milk, pepsi).**

**Mixtures are NOT pure materials.** eg. Pure gold (Au) vs ‘white’ gold (Au+ Ag), or water ( $\text{H}_2\text{O}$ ) vs pepsi ( $\text{H}_2\text{O}$  + sugar....)

Discussion: Air contains a number of *different* components – what are they? How would you describe what air is made up from using words like element, compound, gas, molecular etc.?

Task: Assign generic labels that describe to microscopic scale matter shown on the slide (e.g. 'gaseous atomic element' etc.)

### Mixture Types

As viewed from a *macroscopic perspective*, mixtures are classified as *either* **HOMOGENEOUS** or **HETEROGENEOUS**

#### HOMOGENEOUS MIXTURES:

Examples:

#### HETEROGENEOUS MIXTURES:

Examples:

A Bronze statue of Caesar Augustus

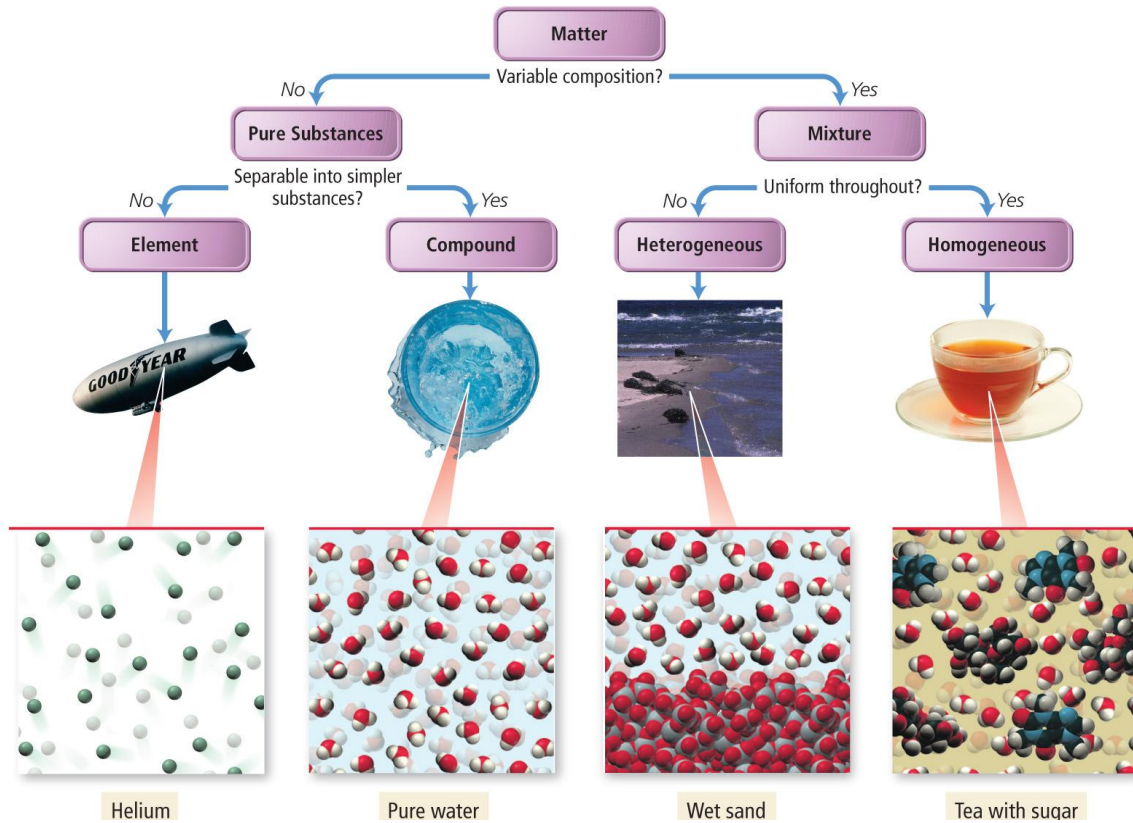

Discussion: Can you think of something that is both a homogeneous mixture *and* a solid?

Examples of Alloys:

Classification of Matter Flowchart

(Dr. Mills really likes this slide – why? Hint: Recall the fundamental job of a chemist)

Task: Use the 'Classification of Matter' flowchart (above) to classify the following:

1. The compressed gasses in a deep sea diver's gas bottle ( $\text{He}(\text{g})$  and  $\text{O}_2(\text{g})$ )
2. A ham and cheese omelet
3. An ice cube (made from pure water)
4. A ruby ( $\text{Al}_2\text{O}_3(\text{s})$  with  $\text{Cr}^{3+}$  impurities)

Extra Credit: Ask me about the separation of mixtures assignment (based on background reading)

*“Mixtures, Elements and Compounds”*

The following questions were taken from your 1<sup>st</sup> practice midterm:

State whether the following are classified as elements, compounds or mixtures\*\*:

Diamond:

Carbon dioxide gas:

Air:

A cup of coffee:

Water:

Sand (SiO<sub>2</sub>):

Oxygen gas:

\*\*include additional details for extra credit!
